Class 5: Data visualization with gg plot

Kevin (PID:16482696)

Today we will have our first play with the $\mathbf{ggplot2}$ package - one of the most popular praphics packages on the planet.

There are many plotting systems in R. These include so-called "base" plotting/graphics.

plot(cars)

Base plot is generally rather short code and somewhat dull plots = but it is always there for you and is fast for big datasets.

If I want to use **ggplot2** it takes some more work.

```
# ggplot(cars)
```

I need to install the package first to my computer. To do this I can use the function install.packages("ggplot2")

Every time I want to use apackage I need to load it up with a library()call.

```
library(ggplot2)
```

Now finally I can use ggplot

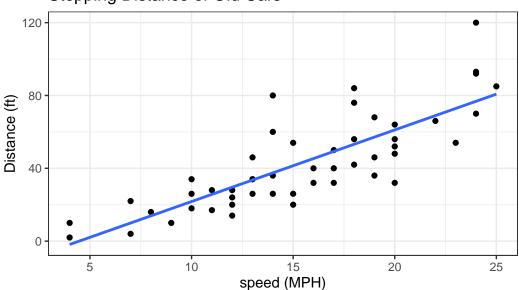

```
ggplot(cars)
```

Every ggplot has at least 3 things:

- data (the data.frame with the data you want to plot)
- aes (the aesthetic mapping of the data to the plot)
- geom (how do you want the plot to look, points, lines, etc.)

```
bp <- ggplot(cars) +
  aes(x=speed, y=dist) +
  geom_point()</pre>
```

Stopping Distance of Old Cars

From the cars dataset

A more comploicalted scatter plot

Here we make a plot of gene expression data:

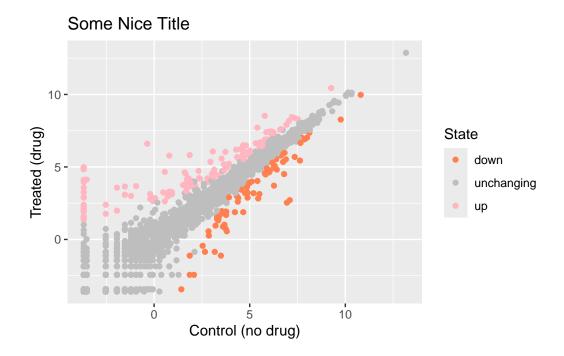

```
url <- "https://bioboot.github.io/bimm143_S20/class-material/up_down_expression.txt"
genes <- read.delim(url)
head(genes)</pre>
```

Gene Condition1 Condition2 State

[`]geom_smooth()` using formula = 'y ~ x'

```
1
       A4GNT -3.6808610 -3.4401355 unchanging
2
        AAAS 4.5479580 4.3864126 unchanging
3
       AASDH 3.7190695 3.4787276 unchanging
4
        AATF 5.0784720 5.0151916 unchanging
        AATK 0.4711421 0.5598642 unchanging
6 AB015752.4 -3.6808610 -3.5921390 unchanging
  nrow(genes)
[1] 5196
  colnames(genes)
[1] "Gene"
                  "Condition1" "Condition2" "State"
  ncol(genes)
[1] 4
Q. Use the table() function on the State column of this data.frame to find out how many 'up'
regulated genes there are. What is your answer?
  table(genes$State)
      down unchanging
        72
                  4997
                              127
  round(sum(genes$State == "up")/ nrow(genes) * 100, 2)
[1] 2.44
  n.gene <- nrow(genes)</pre>
  n.up <- sum(genes$State == "up")</pre>
```

```
up.percent <- n.up/n.gene * 100
  round(up.percent,2)
[1] 2.44
  head(genes,2)
  Gene Condition1 Condition2
                                   State
1 A4GNT -3.680861 -3.440135 unchanging
2 AAAS 4.547958 4.386413 unchanging
  p <- ggplot(genes)+</pre>
    aes(x=Condition1, y=Condition2,col=State)+
    geom_point()
Change the colors
  p + labs(title="Some Nice Title",
           x="Control (no drug)",
           y="Treated (drug)")+
    scale_colour_manual( values=c("coral","gray","lightpink") )
```

Exploring ther gapmider dataset

Here we will load up the gapminder dataset to get practice with different aes mappings.

```
url <- "https://raw.githubusercontent.com/jennybc/gapminder/master/inst/extdata/gapminder.
gapminder <- read.delim(url)</pre>
```

Q. How many entries rows are in this dataset?

```
nrow(gapminder)
```

[1] 1704

Q How many columns?

dim(gapminder)

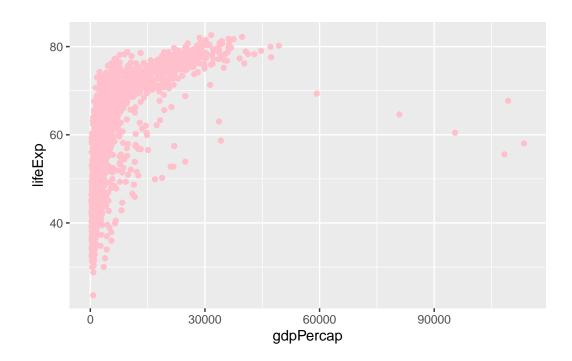

[1] 1704 6

head(gapminder)

[1] 142

```
country continent year lifeExp
                                          pop gdpPercap
1 Afghanistan
                   Asia 1952
                              28.801
                                      8425333
                                              779.4453
2 Afghanistan
